"Complete genome sequence of Caulobacter crescentus.";
Proc. Natl. Acad. Sci. U.S.A. 984136-4141(2001).
-!- FUNCTION: This enzyme is an endounclease that degrades the RNA. RNA-DNA hybrids specifically (By similarity).
-!- CATALYTIC ACTIVITY: Endouncleolytic cleavage to 5'-
phosphomonoester.
-!- COPACTOR: Binds I magnesium ion per subunit (By similarity).
-!- SUBUNIT: Monomer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
-!- SIMILARITY: Belongs to the RNase H family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

-!- FUNCTION: Involved in the formation of 2-(5''-phosphoribosyl)-3'.
dephosphocoenzyme-A, the prosthetic group of the acyl-carrier
protein of the malonate decarboxylase (By similarity).
-!- CATALYTIC ACTIVITY: ATP + 3-dephospho-CoA = 2'-(5''-
triphosphoribosyl)-3'-dephospho-CoA + adenine.
-!- SIMILARITY: Belongs to the citG/mdcB family.
                                                                                                                                           16-OCT-2001 (Rel. 40, Last sequence update)
10-OCT-2003 (Rel. 42, Last sequence update)
Probable 2-(5',-triphosphoribosyl)-3'-dephosphocoenzyme-A synthase
(EC 2.7.8.25) (2-(5',-triphosphoribosyl)-3'-dephospho-CoA synthase)
MDCB OR PA0209.

**, 7EF99C2DE0012680 CRC64;
                   acetyl-ADP-ribose + a protein.
COPACTOR: Binds 1 zinc ion and NAD (By similarity)
SUBCELLINE LOCATION: Cytoplasmic (Probable).
SIMILARITY: Belongs to the sirtuin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     285 A.A.

Thrower Refaction 10 a German Kindred with meebmann by corneal dystrophy.";

Br. J. Ophthalmol. 84:527-530(2000).

-!-FUNCTION: May play a unique role in maintaining the normal corneal epithelial function (By similarity).

-!- SUBUNIT: Heterotetramer of two type I and two type II keratins.

Keratin 3 associates with keratin 12.

-!- SUBUNIT: Heterotetramer of cornea specific.

-!- TISSUE SPECIFICITY: Cornea specific.

-!- DISEASE: Defects in KRT12 are a cause of juvenile epithelial corneal dystrophy of Meesmann (MCD) [MIM:122100]. MCD is an autosomal dominant disease that causes fragility of the anterior corneal epithelium. Patients are usually asymptomatic until adulthood when rupture of the corneal microcysts may cause erosions, producing clinical symptoms such as photophobia, contact lens intolerance and intermittent diminution of visual acuity.

Rarely, subepithelial scarring causes irregular corneal astigmatism and permanent visual impairment. Histological examination shows a disorganized and thickened epithelium with examination shows a disorganized and minimal constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. --- MISCELLAMBOUS: There are two types of cytoskeletal and microfibrillar Keratin, I (acidic) and II (neutral to basic) (40-55 and 56-70 kDa, respectively).
--- SIMILARITY: Belongs to the intermediate filament family.
Kinoshita S.; and chromosomal localization of a cornea-specific human "Isolation and detection of four mutations in Meesmann corneal epithelial dystrophy.";

Note=No experimental confirmation available;
-!- SIMILARITY: Belongs to the CSMD family.
-!- SIMILARITY: Contains at least 10 CUB domains.
-!- SIMILARITY: Contains at least 25 Sushi (SCR) domains.
-!- CAUTION: Ref. 2 (BAC37116) sequence differs from that shown due to multiple frameshifts from position 2763.

EXTRACELLULAR (POTENTIAL).
TISSUE SPECIFICITY: Weakly expressed in most tissues, except in brain. Expressed at intermediate level in brain, including cerebellum, substantia nigra, thalamus, spinal cord, hippocampus and fetal brain. Also expressed in testis.
SIMILARITY: Belongs to the CSMD family.
SIMILARITY: Contains 14 CUB domains.
SIMILARITY: Contains 29 Sushi (SCR) domains.
                                                                                                                                                                                                                                                                        EMBL; AN210419; AAA34702.1; -.

Phospholipase A(2) with platelet aggregation inhibitor activity from Austrelaps superbus venom: protein purification and cDNA cloning.";
Arch. Biochem. Biophys. 375:289-303(2000).
-!- FONCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides. Inhibits collagen-induced platelet aggregation (By similarity).
-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

MAFORT W.E., Kinzler K.W., Vogelstein B.;

"WAFI, a potential mediator of p53 tumor suppression.";

Cell 75:817-825(1993).

-I FUNCTION: May be the important intermediate by which p53 mediates its role as an inhibitor of cellular proliferation in response to DNA damage. May bind to and inhibit cyclin-dependent kinase arctivity, preventing phosphorylation of critical cyclin-dependent kinase substrates and blocking cell cycle progression.

-I SUBCELLULAR LOCATION: Nuclear.

-I INDUCTION: By p53, mezerein (antileukemic compound) and interferon
                                                                                                                                   01-FEB-1995 (Rel. 31, Created)
01-CCT-1996 (Rel. 34, Last sequence update)
10-CCT-2003 (Rel. 42, Last annotation update)
Cyclin-dependent kinase inhibitor 1 (p21) (CDK-interacting protein 1)
(Melanoma differentiation associated protein).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PIR; A.-.

T and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

L FUNCTION: Component of the asymmetric unit membrane (AUM); a highly specialized biomembrane elaborated by terminally differentiated urothelial cells. May play an important role in AUM-cycoskeleton interaction in terminally differentiated urothelial glycocalyx which may play an important role in preventing bacterial adherence (By similarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

Heterodimer formation with Uroplakin Ib.

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

Heterodimer formation with Uroplakin Ib is a prerequisite to exit out of the endoplasmic reticulum (ER).

-!- CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 210.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Richards S., Worley K.C., Hale S., Garcia A.M., Gay L.J., Hulyk S.W., Villalon D.K., Muzny D.M., Sodergren E.J., Lu X., Gibbs R.A., Fahey J., Helton E., Retreman M., Madan A., Rodrigues S., Sanchez A., Whiting M., Madan A.Y. - FUNCTION: The ruvA-ruvB complex in the presence of ATP renatures cruciform structure in supercoiled DNA with palindromic sequence, indicating that it may promote strand exchange reactions in homologous recombination. RuvAB is an helicase that mediates the Holliday junction migration by localized denaturation and reanneling (By similarity).

- SUBINIT: Forms a complex with ruvA (By similarity).

- SIMILARITY: Belongs to the ruvB family.
                                                                                                                                                                                                                                                                                                                                                                                               Read T.D., Brunham R.C., Shen C., Gill S.R., Heidelberg J.F., White O., Hickey E.K., Peterson J., Utterback T., Berry K., Bass S., Linher K., Weidman J., Khouri H., Craven B., Bowman C., Dodson R., Gwinn M., Nelson W., DeBoy R., Kolonay J., McClarty G., Salzberg S.L.                                                                similarity).
SUBCELLULAR LOCATION: Integral membrane protein. Located at the
septum. The large C-terminal part of the protein is cytoplasmic
generating positive supercoils in front of it and negative supercoils behind it (By similarity).
SUBUNIT: Homohexamer. This suggests the formation of a ring between the two cells at the septum that surrounds DNA (By

C -1- FUNCTION: Is thought to be involved in the cytomatrix at the nerve terminals active zone (CAZ) which regulates neurotransmitter release cytomatrix at the nerve terminals active zone (CAZ) which to ERC2/CASTI. Essential in regulated neurotransmitter release from a subset of brain glutamatergic synapses. Involved in the formation of the retinal photoreceptor ribbon synapses (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBDATT: Interacts with ERC2/CAST1, RIMS1 and UNC11A. Part of a complex consisting of ERC2, RIMS1 and BSN (By similarity). SUBCELLULAR LOCATION: Cytoplasmic; localized to the active zone of presynaptic density (By similarity). TISSUB SPECIFICITY: Exclusively expressed in brain. PTM: Myristyolated. The N-terminal myristyolation is not sufficient for presynaptic localization (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MIM, 604020; -...

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

Carra S., Harvey M., Tascedda F., Barden N.;
Submitted (NOV-2001) to the EMBL/GenBank/DDBJ databases.

-1- SIMILARITY: Belongs to the Ser/Thr protein kinase family.

HSSP; 014965; 10L6.
